

**ABSTRACT OF THE DISCLOSURE**

A method and apparatus for jewelry organization is provided which has a body which is specially designed to avoid tangling of jewelry items and to house all types of jewelry at once, in an appealing fashion. The apparatus includes a body having an upper and lower surface, and at least one compartment formed in the upper surface defined as a channel sized to receive one or more items of jewelry. Each piece of jewelry is laid out along the path of the channel and does not mix or tangle with other pieces of jewelry. The upper surface of the body has an upwardly protruding knob. The knob may be frustoconical in shape and can hold at least one ring. The presently preferred knob is located in the center of the upper surface. The lower surface of the body may have a recess which is sized to receive a knob on a second jewelry organizer. The knob nests into the recess of another jewelry organizer so that the organizers can be stacked on top of one another.
